# LayerAlterator: A Raster Processing Tool for Urban Change Simulation

**Author:** Amirhossein Donyadidegan

**Supervisor:** Dr. Daniele Oxoli

**Course:** GeoInformatics Project (GIP), AY 2024–2025

**Date:** Jun 2025

# Introduction

## Urban Change Modeling: A Need for Lightweight Tools

- Urban planners need to test interventions like reforestation or densification.
- Existing tools (e.g. LCZ classification, full climate models) are often too heavy or rigid.

**LayerAlterator** offers a modular, fast alternative:

- Modify raster layers using **polygon-based rules**
- Supports **masking** (absolute) and **percentage** (relative) updates
- Built with open-source Python libraries

# Related Work

## Urban Raster Processing in Literature

### Local Climate Zones (LCZ)

- Stewart & Oke (2012): Classification for urban temperature modeling
- *Rigid categories, not designed for dynamic simulation*

### Urban Land Cover Mapping

- Okujeni et al. (2016): Fractional abundance via spectral unmixing
- *Provides detailed input layers but no simulation capability*

### Climate Modeling Platforms

- Require high computational resources and complex inputs

| Tool           | Focus                 | Limitation            |
|----------------|-----------------------|-----------------------|
| LCZ            | Urban class mapping   | No layer modification |
| Okujeni        | Fractional land cover | Static data           |
| LayerAlterator | Rule-based simulation | Lightweight           |

# Innovation

## What Makes LayerAlterator Unique?

- **Supports both masking and percentage operations**  
Apply absolute values *or* modify relative to the current raster data.
- **Rule-driven engine**  
Uses simple JSON configuration for flexible simulations.
- **Modular Python architecture**  
Easy to extend, debug, or integrate into Digital Twin platforms.
- **Built-in validation**  
CRS, normalization, and attribute checks prevent faulty simulations.
- **Transparent and reproducible**  
Designed for Jupyter workflows, with visual inspection support.

# Architecture Overview

## Modular & Reproducible Processing Pipeline

- **Main Controller:** `layer_alterator()` orchestrates the workflow
- **Key Phases:**
  - ❑ Input Loading: `load_vector_mask()`, `check_crs_match()`
  - ❑ Rule Handling: `parse_rules_from_mask()`,
  - ❑ Masking Ops: `apply_masking()`, `apply_mask_rule_all()`,
  - ❑ Percentage Ops: `apply_pct_ucp()`, `apply_pct_all_fractions()`, `apply_pct_all()`
- Functions are independently testable and integrated in Jupyter
- Validation embedded in every major step

# Input and Rule Logic

## Input Types

- **Vector Mask:** Polygons (e.g., .gpkg, .geojson) with attribute values
- **Raster Layers:**
- **Rule File:** rules.json defines layer operations

## Rule Logic

- Operations: mask, pct, none
- Classified into rule types (C0 to C5)
- Invalid mixes (e.g., mask + pct) trigger errors

# Output Example

## Traceable Raster Output

- **Processed rasters saved in the output/ folder**
- **Naming Convention:**
  - ❑ \*\_mask.tif → layers updated with fixed values (masking)
  - ❑ \*\_pct.tif → layers updated with percentage changes
- **CRS, NoData, and resolution preserved**
- **Visual verification in QGIS (e.g., coverage, alignment, NoData integrity)**
- **Metadata and filenames support scenario comparison**

# Validation and Testing

## Ensuring Data Integrity and Simulation Accuracy

- **Validation Checks (Pre-Processing)**

- ☐ CRS match between vector and rasters
- ☐ Required attributes present
- ☐ Rule logic consistency

- **During Processing**

- ☐ NoData regions preserved
- ☐ Normalization of fractional rasters
- ☐ Warnings for overlapping polygons or abnormal updates

- **Testing Strategy**

- ☐ Unit tests in Jupyter Notebook (test\_functions.ipynb)
- ☐ Visual inspection in QGIS
- ☐ Controlled edge-case scenarios

```
--- Test 1: All CRS Match ---  
All raster layers have the same CRS as the vector mask.  
  
--- Test 2: All Rasters Match CRS but Different from Vector ---  
Warning: CRS mismatch detected in the following layers:  
- BH.tif: CRS = EPSG:32632, differs from vector CRS = EPSG:7415  
- F_AC.tif: CRS = EPSG:32632, differs from vector CRS = EPSG:7415  
  
--- Test 3: CRS Mismatch ---  
Warning: Could not open raster for layer IMD_differentCRS.tif: test_data/fun_2/  
IMD_differentCRS.tif: No such file or directory  
All raster layers have the same CRS as the vector mask.  
  
--- Test 4: Missing Raster File ---  
Warning: Could not open raster for layer nonexistent.tif: test_data/fun_2/nonex:  
No such file or directory  
All raster layers have the same CRS as the vector mask.
```

```
--- Test 4: Mix of pct and none ---  
Rule C3: Layers set to PCT and NONE. Proceeding wi  
  
--- Test 5: Mix of mask and none ---  
Rule C4 violation: MASKING + NONE is not allowed.  
  
--- Test 6: Mix of mask and pct ---  
Rule C5 violation: MASKING + PCT is not allowed.
```

# Demonstration

## Scenario: New Highway in Milan

- **Objective:** Simulate the effect of a new highway on urban surface characteristics.
- **Inputs:**
  - ☐ Vector polygon for highway area (in .gpkg)
  - ☐ Rule: Apply mask to set land cover fractions (e.g., increase F\_AC, reduce F\_G)
- **Execution:**
  - ☐ layer\_alterator() applied with rules.json and polygon attributes
  - ☐ Outputs generated: F\_AC\_mask.tif, F\_G\_mask.tif, etc.
- **Results:**
  - ☐ Clear spatial update of asphalt fraction (F\_AC)
  - ☐ Preservation of surrounding NoData
  - ☐ Ready-to-use outputs for further modeling (e.g., UHI impact)

# Demonstration

Comparison for BH.tif

Comparison for SVF.tif

# Conclusions

## Project Achievements

- Delivered a working tool for spatial raster updates via vector-defined rules
- Successfully supports both deterministic (mask) and relative (pct) operations
- Modular architecture with embedded validation ensures reliability
- Integrated into Jupyter for transparent, reproducible workflows

## Impact & Future Work

- Valuable tool for urban planning, especially in Digital Twin contexts
- Enables “what-if” simulations with minimal overhead
- Future extensions:
  - ☐ GUI or API interface
  - ☐ Batch rule processing
  - ☐ Tiled processing for large datasets
